Copper Finish Guide

Living Finish

This copper is not treated with a sealant and will age naturally and keep its anti-microbial finish. This finish can be characterized as maintenance free, since scratches and blemishes will blend in and even out with time. Avoid abrasive cleaning products, or use of steel wool or similar scrubbing pads that may remove your decorative patina. Do not place hot pans directly in the sink from the stove. Simply wash your sink with soap and water. For a more vibrant look, add a thin layer of carnauba wax on occasion, or Bayes teak cleaner spray.

Sealed Finish

This copper is treated with a sealant to protect it from further patina or color changes. This is perfect for the homeowner looking to have their product hold an exact color. It is important to note that if the sealant is compromised, from a scratch or extreme heat, further patina changes may occur. Avoid abrasive cleaning products, or use of steel wool or similar scrubbing pads that may remove the sealant. Do not place hot pans directly in the sink from the stove. Simply wash your sink with soap and water. For added protection and a more vibrant look, add a thin layer of carnauba wax on occasion.

Raw Copper

All products ordered in "Raw Copper" will also be living finish. This copper is not treated with a sealant and will age naturally and keep its anti-microbial finish. You may use a scotch bright pad to control the patina of your raw copper product by scrubbing lightly until you reach your desired patina, or simply let your copper product patina naturally for a truly authentic look. You can then add a carnauba wax to deter further patina. You may wish to use Bayes Teak cleaner in raw copper sinks to bring out more of their natural beauty. *Raw copper products will likely come with a few finger prints on them. Over time these will blend in.
